

# Update Files in SVN (Legacy .CHM Files)

## Contents

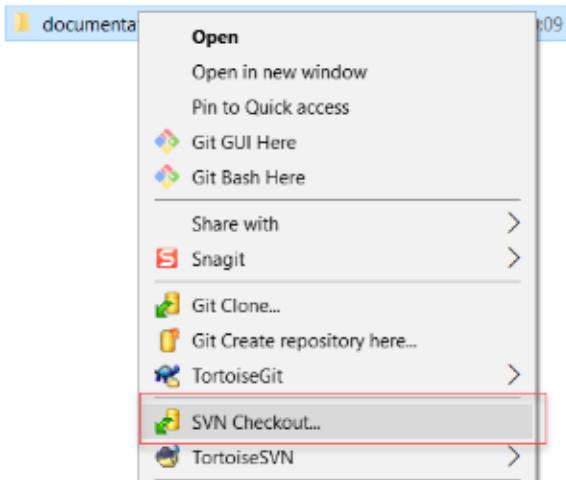

- [Download the Source Files](#)
- [Work on Source Files](#)
- [Print the Master Help in Your Local Folder](#)

## Download the Source Files

1. Install TortoiseSVN on your computer.
2. In your computer, create a folder structure: C:\Projects\plant\_apps\documentation\_source.

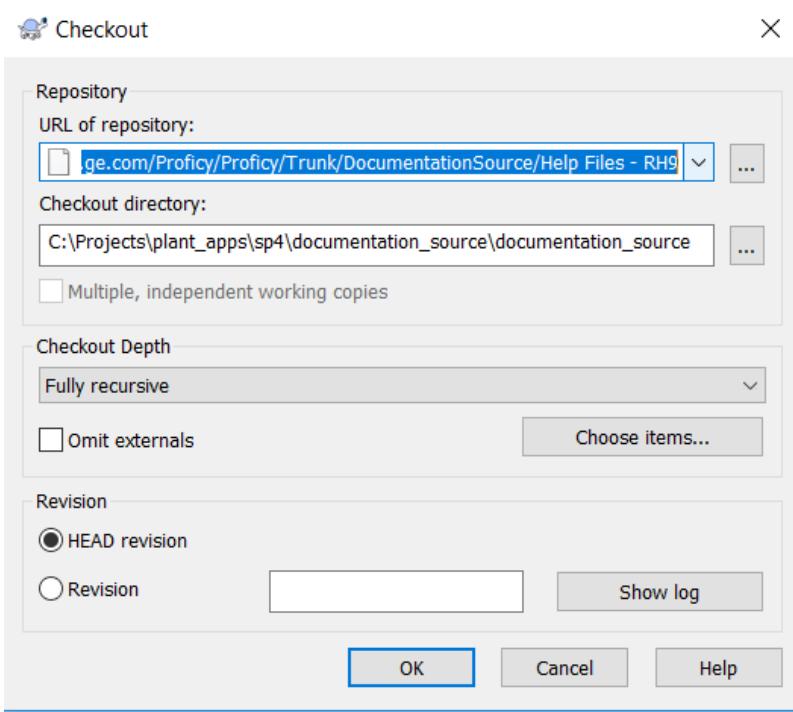

3. Right-click the folder and select **SVN checkout**.

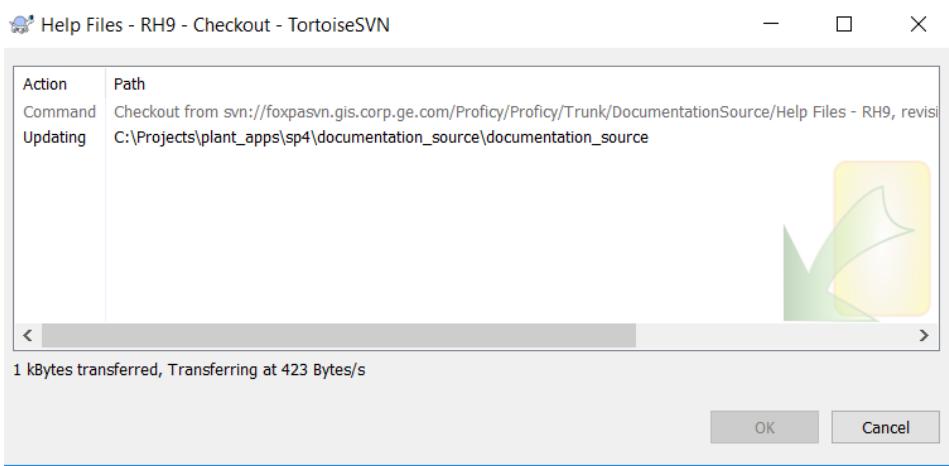

4. In the **URL of repository** box, enter svn://foxpasvn.gis.corp.ge.com/Proficy/Proficy/Trunk/DocumentationSource/Help Files - RH9.

**Note:** If the SVN is unable to locate the URL, in the **URL of repository** box, select ... to browse the path svn://foxpasvn.gis.corp.ge.com/Proficy/Trunk/DocumentationSource, and then manually select the folder Help Files - RH9.

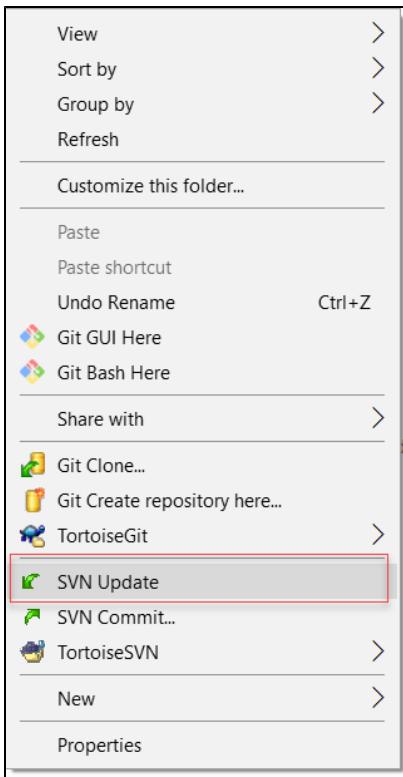

5. Select **OK**. The following window appears. Ensure that all files are transferred and then select **OK** on this window.

## Work on Source Files

1. Send an email to other **Plant Applications writers** that you are updating the file.  
**Important:** This step ensures that you coordinate with other writers to avoid any conflicts made to your files.
2. Locate the relevant Help file/folder and right-click within the folder and select **SVN Update**.  
**Important:** This step ensures that you have the latest version of all source files.

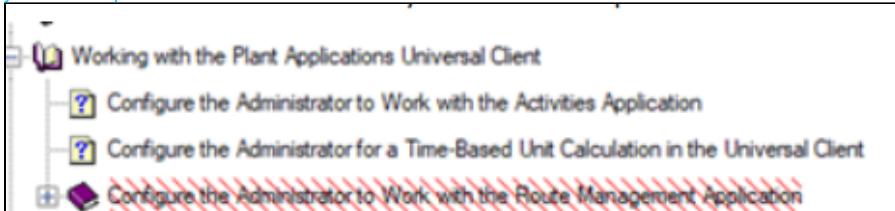

**3.** Open the RoboHelp HTML Project File (an .xpj file) in RoboHelp.

For example, to update the Plant Applications Administrator help topics, locate the PA Master Help folder, and then open the **PAMasterHelp.xpj** file (RoboHelp HTML Project File) in RoboHelp.

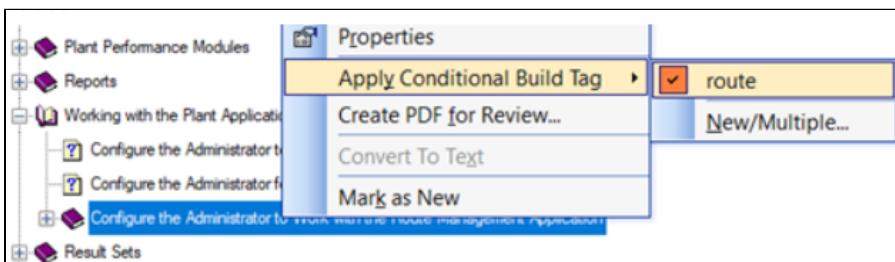

**4.** Add or update your topics.

**Important:** You must define and use conditional tags to include or exclude your topics or texts from a release, and then include information about conditional tags on the [Legacy Help Files Updates Tracking](#) page.

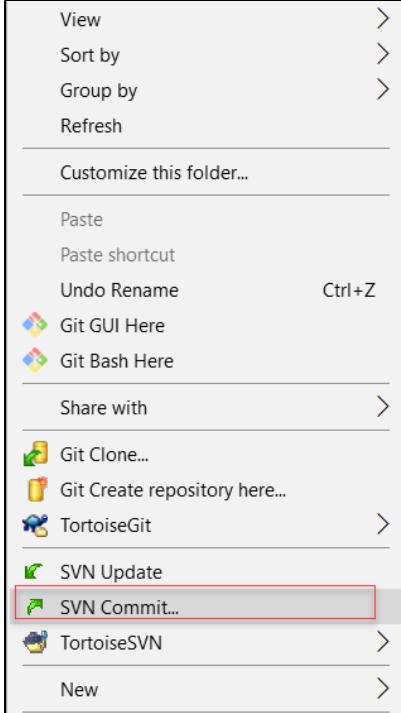

**Example:** For topics related to Plant Applications Universal Client help, expand [Working with the Plant Applications Universal Client](#) and add your book/topics.

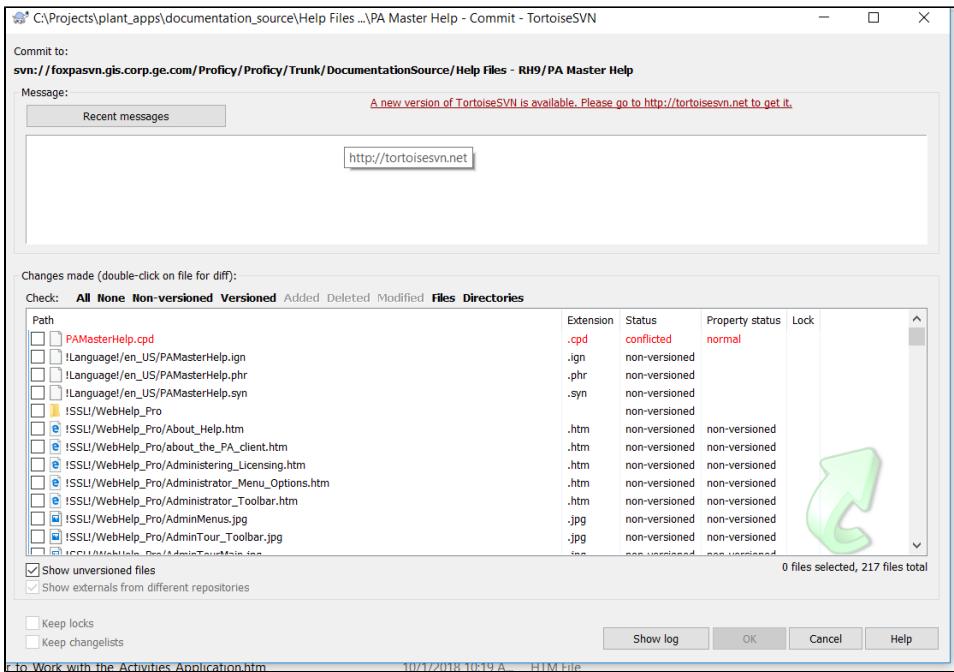

The conditional tag 'route' is used at the book-level to exclude the route topics from printing. To print a route topic, right-click the topic and select **Apply Conditional Build Tag**, and then deselect **route**.

5. After you perform changes to your topics, right-click within the folder and select **SVN Commit**.

6. in the text box below **Recent messages**, enter the release number and other details for the topic, and then select files that you want to commit in the **Changes made** box.

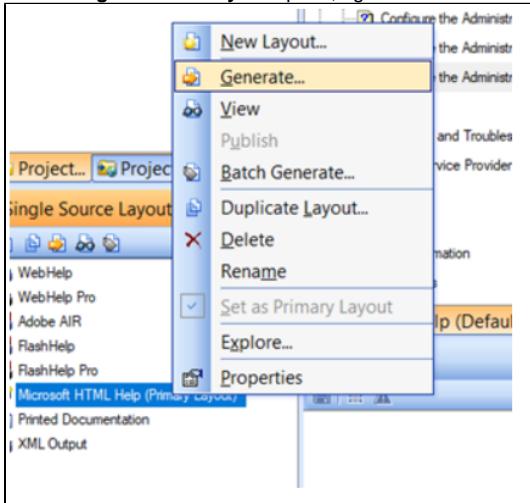

7. Select **OK** after you select all required files.

8. Send an email to other **Plant Applications writers** that you have committed your changes.

**Important:** This step ensures that other writers can perform SVN update to obtain latest versions of files before they update any topics.

## Print the Master Help in Your Local Folder

1. In the **Single Source Layouts** pane, right-click **Microsoft HTML Help (Primary Layout)**, and then select **Generate**.

2. Verify if the folder structure in the **Output Folder and File Name** exists in your computer.

3. Select **Save and Generate**. The file is generated locally.

**Important:** Ensure that you coordinate with your lead before you commit any generated outputs in to SVN.
